

***In the Specification***

Please replace the originally filed paragraph **(0144)** with the following replacement paragraph to correct an obvious typographical error in the last sentence of the paragraph.

**(0144)** In the embodiments and examples, metal-based electrodeposits are shown to form surface portions of the article. It is understood that these metal-based electrodeposits could be further coated with additional electrically conducting or electrically insulating materials to achieve benefits characteristic of those materials. For example, the electrodeposit could be laminated with a polymeric layer for environmental or decorative reasons. For purposes of this invention, a surface defined by an electrodeposit or other material need not be a surface actually formed by that material, rather it is the surface shape or pattern characteristic by the referred to materials even though they may be underlying other materials.
